DETAILED ACTION

Claim Rejections - 35 USC § 102

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

2. Claims 1-4, 13-16, 23-26, and 34-37 are rejected under 35 U.S.C. 102(b) as being anticipated by Perholtz (U.S. Patent No. 5,732,212, hereinafter Perholtz).

In considering claims 1-4, 13-16, 23-26, and 34-35, Perholtz discloses a method for securing an accessible computer system, the method comprising:

monitoring a computer system for connection transactions between at least one access requestor and at least one access provider (col. 31, lines 25-35); and

denying access by the access requestor to the access provider when a number of connection transactions initiated by the access requestor exceeds a configurable threshold number during a first configurable time period (col. 31, lines 51-60).

In considering claims 36-37, Perholtz discloses wherein the monitoring component and the blocking component are included in a host computer and switch that receives communication (col. 31, lines 1-14).

Claim Rejections - 35 USC § 103

3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

4. Claims 5-12, 17-22, and 27-33 are rejected under 35 U.S.C. 103(a) as being unpatentable over Perholtz in view of Allard.

In considering claims 5-9, 17-19, and 27-29, while Perholtz discloses detecting connection transactions between at least one access requestor and the access provider, counting the number transactions initiated by the access provider during a configurable time period, and comparing the number of connection transactions during a configurable time period to a configurable threshold number, Perholtz does not explicitly state wherein the access provider is detected based upon its Internet Protocol address.

Nonetheless, the uses and advantages for using an Internet protocol address to detect connection transactions between and access providers is well known as evidenced by the teachings of Allard (at col. 7, lines 20-30).

In similar art Allard discloses a system for client-side usage tracking which tracks usage patterns of users of hyper-media systems such as the World-Wide web. Allard also discloses wherein the user is tracked by the URL received at the initiation of the session via the HTTP. Therefore, one of ordinary skill in the art at the time the invention was made would have found it obvious to incorporate and implement the URL tracking mechanism in the system as disclosed

by Perholtz in order for the access provider to be provided with a variety of useful, and accurate information about the access requestor.

In considering claims 10-12, 20-22, and 30-33, the aforementioned claims contain similar limitation to those previously rejected in claims 1-4, however, the claims specify a second configurable time period that is not explicitly disclosed by the combined systems of Perholtz and Allard. Nonetheless, the uses and advantages of a second configurable time period are well to one skill in the art. A person with ordinary skill in the art would have been motivated to incorporate a second configurable time period in which the users could have access to the system in order to provide more security restrictions on the users thereby ensuring a more secure system.
